## ABOUT ME

I am a Product / Graphic designer and amateur musician born in Slovakia. I was always interested in all forms of art particularly in design of all sorts. I aim to become professional designer and to own self sustaining business, preferably clothing brand.

## SOFT SKILLS

Teamwork / creativity / efficiency

## SOFTWARE SKILLS

Adobe Illustrator

Adobe Photoshop

Adobe InDesign

Rhinoceros

Keyshot

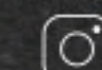

## EDUCATION

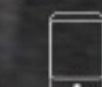

University of Thomas Baťa in Zlín  
Bachelors degree in product design

*Logo pre Martinské Divadlo mladých. Chcel som do tejto práce vložiť dynamiku, ktorá je divadlu vlastná a ide s ním ruka v ruke. M opisuje druhé M a spolu sa stretávajú pri D. Rozhodol som sa M a M prepojiť kvôli hybnému divadlu.*

DISCOBOLUS

The potential energy expressed in this sculpture's tightly wound pose, expressing the moment of stasis just before the release, is an example of the advancement of Classical sculpture

The Discobolus of Myron is a Greek sculpture completed at the start of the Classical period at around 460–450 BC. The sculpture depicts a youthful male athlete throwing discus. The original Greek bronze is lost but the work is known through numerous Roman copies, both full-scale ones in marble, which was cheaper than bronze, such as the first to be recovered, the Palombara Discobolus, and smaller scaled versions in bronze.

What's the last pair of shoes you bought? Let me guess: sneakers. Maybe a pair of collectible, cartoonishly colored Nikes?

See the page 15 for original take on the Nikes

These kinds of shoes from Nike — which feature carbon plates and springy air-like foam — have become an explosive force among runners, as professional and amateur runners alike debate whether the shoes are so much energy that they amount to an unfair advantage.

A new analysis by The New York Times, an update of the one conducted last summer, suggests that the advantage these shoes brings is real — and larger than previously estimated.

At the moment, they appear to be among only a handful of popular shoes that confer all of the race performance and the gap between them and the next fastest popular shoe has only widened.

We found that a runner wearing the most popular

version of these shoes available to the public — the Zoom Vaporfly 4+ or ZoomX Vaporfly Next% — ran 4 to 5 percent faster than a runner wearing an average shoe, and 2 to 3 percent faster than runners in the most famous popular shoe. (There was no meaningful difference between the Vaporfly and these shoes when we measured their effects separately. We have combined them in our estimates.) This difference is not explained by faster runners choosing to wear the shoes, by runners choosing to wear them to confer easier or by runners switching to the shoes after running more training miles. In a race between two marathoners of the same ability, a runner wearing these shoes would have a significant advantage over a competitor not wearing them.

The shoes, which retail for \$250, confer an advantage on all kinds of runners, men and women, fast runners and slower ones, hobbyists and frequent racers.

Many other brands, including Brooks, Hoka, New Balance, Nike One and Asics, have introduced similar shoes to the market or plan to. These shoes may provide the same advantage at an even larger cost, but most do not yet appear in sufficient numbers in our data to measure their effectiveness.

These findings are based on more than 600,000 data that produced our previous estimates. Our data now includes results from more than a million marathons and half marathons conducted since 2014.

More important, nearly all of these new results take place in a world in which runners had begun to wear these shoes in large numbers. In this period, an overwhelming share of runners — particularly faster
